

# Long-Term Performance of Super-Insulating Materials in Building Components and Systems

## EBC ANNEX 65

Current energy conservation standards often call for space saving insulation technologies, especially for building refurbishment. Therefore, new super insulating materials (SIM), such as types of vacuum insulation panels (VIP), gas filled panels (GFP) and aerogel based products (ABP) have been rapidly spreading in the building insulation market. They have become attractive alternatives that allow a reduction of the insulation thickness by as much as a factor of five. However, besides offering excellent insulation performance, these materials are relatively expensive and there is a lack of information on their durability under different hygrothermal conditions.

This research project has investigated potential long term benefits and risks of newly developed super insulation materials and systems and has provided guidelines for their optimal design and use. The target audience of the project outcomes is construction industry partners, architects and building designers, building owners and standardisation organisations.

### PROJECT OBJECTIVES

- 1 improve knowledge and confidence of decision makers and planners regarding super-insulating materials,
- 2 provide reliable data on properties, durability and sustainability,
- 3 secure implementation techniques,
- 4 serve as a basis for future standards, and
- 5 provide a clear description of the measurement procedures and the testing methods for ageing tests.

Possible applications of new super insulating materials

## INTERNATIONAL ENERGY AGENCY

The International Energy Agency (IEA) was established as an autonomous body within the Organisation for Economic Co-operation and Development (OECD) in 1974, with the purpose of strengthening co-operation in the vital area of energy policy. As one element of this programme, member countries take part in various energy research, development and demonstration activities. The Energy in Buildings and Communities Programme has co-ordinated various research projects associated with energy prediction, monitoring and energy efficiency measures in both new and existing buildings. The results have provided much valuable information about the state of the art of building analysis and have led to further IEA co-ordinated research.

## EBC VISION

By 2030, near-zero primary energy use and carbon dioxide emissions solutions have been adopted in new buildings and communities, and a wide range of reliable technical solutions have been made available for the existing building stock.

## EBC MISSION

To accelerate the transformation of the built environment towards more energy efficient and sustainable buildings and communities, by the development and dissemination of knowledge and technologies through international collaborative research and innovation.

*Vacuum insulation panel (VIP)*

*Aerogel based product (ABP)*

### Project duration

Completed (2013–2019)

### Operating Agent

Daniel Quenard  
Direction Energie & Environnement  
Division Enveloppe et Matériaux Innovants  
Centre Scientifique et Technique du Bâtiment  
24, Rue Joseph Fourier  
38400 Saint Martin d'Hères, FRANCE  
+33 476762546  
daniel.quenard@cstb.fr

### Participating countries

Belgium, Canada, P.R. China, France, Germany, Italy, Japan,  
R. Korea, Norway, Spain, Sweden, Switzerland  
Observers: Greece, Israel
